

COMPARATIVE ASSESSMENT OF TEMPORARY RUST PREVENTATIVES FOR STEEL PARTS IN STORE – 2ND SERIES

This report supplements work published in April 1970, concerning the effectiveness of corrosion inhibitors for stored steel parts with comparative tests on a further range of products that became commercially available in the interim.

The 29 product samples tested in this series are classified as follows:

- Hard film – solvent deposited
- Soft film – solvent deposited
- Grease type, soft film – solventless
- Non drying oils

The data on the previously recommended materials have been compared with the results presented in this report, in order to obtain overall indications of the protectives which appear the most economical of their type.
